# **EXECUTIVE SUMMARY**

The decline of the Sumatran and Javan rhino has been going on for a long time. The Javan rhino for example was eliminated from Malaysia in the 1930's, while the decline of Sumatran rhino was probably 50% during the last decade. The total world population of Sumatran rhino is estimated at about 300 and the species will become extinct in the next decade if there is no appropriate and serious protection and management.

The rhino's decline in South East Asia is due to a combination of reduction in habitat and overexploitation, mostly by poaching for the horn. Even now poaching pressure continues to be high in Indonesia, hence there is a need to emphasize anti-poaching activities in the Rhino Conservation Program in this country.

The rhino is subject to poaching pressure both from hunters with firearms and from trappers who use wire snares and other traps that maim and kill the animals. The decline in range and numbers in Sumatra is attributed chiefly to fragmentation of its habitat through indiscriminate forest clearance and to poaching, stimulated by the illegal trade in horns, hooves and other parts.

The Indonesian Rhino Conservation Program (IRCP) [*Program Konservasi Badak Indonesia* (*PKBI*)] integrates governmental and non-governmental partners: the Directorate General of Protection and Nature Conservation (PKA), Ministry of Forestry and Plantations, International Rhino Foundation (IRF), Asian Rhino Specialist Group (AsRSG) and Yayasan Mitra Rhino (YMR). The MoU signed in Jakarta on 14 January 1998. The IRCP is a continuation of the UNDP/GEF program "Conservation Strategy for Rhinoceros in South East Asia" that started in April 1995. The MOU renewed on 2 October 2003 in Jakarta for the next five years, and currently running till 31 December 2008.

The program entails a series of approaches that include: (a) wild population protection by intensive patrolling of areas to detect traps and arrest intruders; (b) more intensive surveys and monitoring of the rhino populations throughout the core rhino areas; (c) intelligence operations to assist in the apprehension of poachers and to identify the routes used for the horn trade; (d) establishment of a rhino database system using Geographic Information System (GIS) techniques.

The involvement of a large number of field personnel makes the IRCP program very costly. Therefore, it is important to develop a simultaneous plan for sustainable funding of the Rhino Conservation Program.

#### INTRODUCTION

#### **Background**

A Population and Habitat Analysis conducted in November 1993 in conjunction with the IUCN SSC Asian Rhino Specialist Group (AsRSG) and Conservation Breeding Specialist Group (CBSG) revealed a significant decline in the numbers of Sumatran rhino in Indonesia. The estimates that emerged from the new data and more rigorous assessment was 215 – 319. Meanwhile, the previous estimate had been 420 – 875. The GEF project estimated, based on the assessment of total range and a summation of estimated local rhino numbers, that until June 1998 the population of Sumatran rhino in Bukit Barisan Selatan National Park (TNBBS) 28 – 40, in Way Kambas National Park (TNWK) 15 – 24, and in Kerinci Seblat National Park (TNKS) was 27 – 32.

In the year of 2004, the IRCP estimated the number of Sumatran rhino in TNBBS was about 60 - 85, in TNWK 20 - 27, and at TNKS 2 - 3 in TNKS. Since February 2005, no rhino's sign have been encountered in areas where RPUs operated in Kerinci Seblat National Park, and the field operations have since been terminated.

Although the Javan rhino population in Ujung Kulon National Park seems to be holding at about 50 –60, the threat of poaching remains. Since 1980, the number of javan rhinos in Ujung Kulon has not increased, despite rigorous protection and only few cases of rhino poaching being discovered since. The stagnation of the Javan rhino population has become a matter of global concern

Saving the remaining population needs further alternatives. There should be a series of efforts to protect the remaining population by activating rhino patrols and strengthening anti-poaching activities, until poacher activity is reduced to the point of elimination and habitat destruction has stopped. Furthermore, new populations need to be established throughout the historic range in suitable secure habitats where the rhinos have been exterminated. Semi natural reproduction in sanctuary style centers may be an essential tool to achieve rapid expansion of numbers, until the world population has grown till at least 2500.

# **Objectives, Outputs, Targets and Outcomes**

# **Objectives:**

The main objective of the cooperation between the Directorate General of Forest Protection and Nature Conservation, International Rhino Foundation, Yayasan Mitra Rhino, and Asian Rhino Specialist Group is to contribute to the long-term viable conservation and management of Indonesian rhinos (the Javan rhino – *Rhinoceros sondaicus*, and the Sumatran rhino – *Dicerorhinus sumatrensis*) and their habitats in Java and Sumatra through collaboration and coordination for planning, funding, administration and implementation of Rhino Conservation Programs.

The Indonesian Rhino Conservation Program aims:

- To enhance the capabilities of the Directorate General of Forest Protection and Nature Conservation and associated wildlife agencies to arrest and reverse the decline of rhinos due to poacher activity and habitat disturbance toward the National and global goal of recovery of viable populations of rhino species in Indonesia.
- 2. To enhance bio-diversity conservation in Indonesia through technical training preparation, operational support, and strategy for long term funding plans.
- 3. Local community involvements as active participate in rhino conservation efforts.

#### **Outputs:**

- 4. Establishment and operation of at least 15 Rhino Protection Units (RPUs) in Sumatra and Java.
- 5. More involvement of local people through recruiting into RPU personnel.
- 6. More accurate and reliable information on rhino distribution and population in Java and Sumatra based on facts finding of signs of rhino such as footprint, dung, wallows direct sighting and other, as survey and patrol conducted.
- 7. More accurate and reliable information on illegal activities within the National Park such as illegal poaching, forest encroachment, field crops, illegal fishing, and others.
- 8. Other information linked to the rhino conservation program in the National Park.

#### **Targets:**

- 1. Units of RPUs operational in Sumatra and Java.
- 2. Distribution of key populations of Sumatran and Javan rhino in Java and Sumatra established.
- 3. Methods, networks and "modus operandi" of poaching and rhino horn trade identified.
- 4. Effective law enforcement for rhino poaching cases and forest destruction and rhino poachers routinely convicted in Indonesia
- 5. To provide a safe and secure habitat for rhinos and other wildlife, free from poaching and forest encroachment.

#### **Outcomes:**

- 1. Enhancing the capabilities of the Directorate General of Forest Protection and Nature Conservation and associated wildlife agencies to arrest and reverse the decline of rhinos due to poacher activity and habitat disturbance toward the national and global goal of recovery of viable populations of rhino species in Indonesia.
- 2. Poacher activity will be reduced to the point of elimination within areas covered by the units as measured by numbers of traps and poachers detected by patrols and the numbers of rhino known to be lost.
- 3. Improved information on rhino numbers and distribution.
- 4. Improved management of the national Parks by authorities.
- 5. Benefits and incentives for local communities by employing them in the RPUs.

#### PROGRESS REPORT 2006

#### **Progress:**

The IRCP operates 16 anti-poaching units in three rhino areas in Sumatra and Java, Indonesia. Eight units or teams operating in BBS, five units in Way Kambas, and three units in Ujung Kulon National Parks.

Each RPU consist of four persons and is primarily an anti-poaching team that intensively patrols rhino/tiger areas to destroy traps and snares as well as to interdict or apprehended poachers. Although the basic unit is four persons, combined teams with additional personnel from the Park or from the police or other government agencies are formed when required. Especially when operating against a gang of illegal loggers large groups is needed for security. For intelligence operations, often-smaller teams or individual assignments are required

The leader of each RPU is a PHKA ranger, who has the authority to carry firearms and arrest suspected poachers. RPU's may arrest suspects in the act of committing crime. They must then, and as soon as possible, hand them over to a civil investigator item (to be formally confiscated by the park or police) as evidence, and they must prepare a crime report for the civil investigator. Beyond this point they have no further rights, but will be called as witness if the case is brought to court.

The other members of the RPU, including the field coordinators and administrators, have been recruited from local communities in the vicinity of the rhino areas in which the RPU operates.

Patrols and surveys are the RPU primary function. Patrolling is to locate and apprehend illegal intruders, deactivate traps, and investigate crime scenes. Surveying is to find and locate sign of rhino, tiger and other endangered wildlife.

Patrolling is primarily conducted on foot but in Way Kambas and Ujung Kulon part of patrols are by boat. The patrols vary in length from a few hours to a week. During patrols in rhino areas, rhino signs observed also noted but the primary goal is law enforcement and protection of the area and it's wildlife.

Surveying is also conducted on foot. The primary aim is to record rhino sign, but other wildlife species are also recorded. The information gathered is used to identify rhino areas, attempt to identify individuals, and gather other information. After each survey and patrol the team leader makes a written report to the Head of the National Park and the program HQ in Bogor.

In BBS, since 2004 the IRCP establishes and still operates a special mobile Intelligence and Law Enforcement Unit (ILEU) to assist the RPUs and the National Park in the detection and apprehension of poachers and to assist the prosecution of suspects till the time that the case is filed with the courts.

Project deliverables are detailed records of patrol activities, including the number of surveys, the distance traveled for each survey/patrol (distance walked) and the duration of the time spent in the field (hours in the field). These data are used to assess the Personnel Performance as the number of field days per-person per-month. The target for the performance is at least 15 days per-person per-month on patrol for each RPU. (See Figure 1. General Performance Parameters).

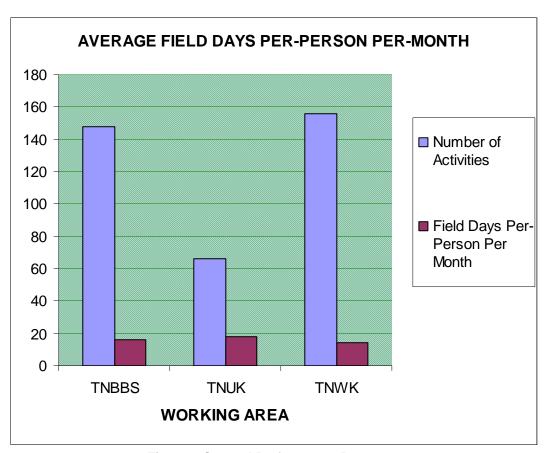

Figure 1 General Performance Parameter

Working Area	Number of activities	Number of Patrol/Survey	Number of Days	Distance walked (Km)	Field days per- person per- month
BBS	148	121	1.031,00	3,675.7	15.87
WK	156	88	458,00	2,756.69	14.07
UK	66	44	435,00	1,823.11	18.03
TOTAL all	370	253	1.924	8,255.5	Mean 15.99

In the year of 2006, Each RPU in BBS and Ujung Kulon performed better than the minimum target number of field days per-person per-month (15), while in Way Kambas they achieved slightly below the minimum target of field days.

**Bukit Barisan Selatan National Park.** A total of 121 surveys/patrols were conducted during the year, covering 3.675,7 km, consuming 1.031 team days (excluding other activities). The number of activities of the RPU was higher than in the previous year. However, the number of field days per-person per month of RPU personnel in this working area decreased (15.87), but slightly above the minimum target of field days per-person per-month. No rhino phenomena like "rosa' discovered during the year. The teams patrolled twice for each month and number of days for each patrol is almost seven days.

The southern half of BBS is most intensively patrolled, as this is the core area for Sumatran Rhino and many of the disturbances and encroachments occur in this part of the Park. The northern half of BBS has only very few rhinos surviving. Therefore, the areas covered at least once a year to monitor the developments.

**Way Kambas National Park.** A total of 88 surveys/patrols were conducted during the year, covering 2,756.69 km, consuming 458 team days (excluding other activities). The number of field days per-person per-month has been below the target of 15 field days per-person permonth.

Many of the RPU activities in WK are short operations of less than a week, such as joint operations with NP to evict encroachers, intelligence, investigations on illegal trade and poaching, field patrols only for destroying traps intended for rhino and tiger, etc.

**Ujung Kulon National Park.** A total of 66 patrols/surveys has been conducted during the year, covering 1,823.11 Km's length, consuming 435 team days (excluding other activities). Mostly the numbers of field days per-person per-month of the RPUs in Ujung Kulon are higher than the other areas, because of differences in the methods of calculation field days.

#### RHINO STATUS AND DISTRIBUTION

#### **Outputs:**

More accurate and reliable information on rhino distribution and population in Java and Sumatra based on facts finding of signs of rhino such as footprint, dung, wallows direct sighting and other, as survey and patrol conducted.

#### **Progress:**

Surveys and patrols are the RPU's primary function and are conducted on foot. The primary aim is to seek signs of rhino. The information gathered is used to identify all rhino areas, to identify individuals, and to gather information on the rhino's activities like feeding, wallowing, defecation, etc. Information on other large mammals is also collected during these surveys. At the end of each survey and patrol, the team leader makes a written report.

The type and number of location of rhino signs encountered is tabulated below.

Table 1. NUMBER OF RHINO SIGNS ENCOUNTERED IN 2006

Working	Number	signs had	been enco	untered		
Working Area	Footprint	Wallow	Dung	Food	Other Signs	Direct Sighting
BBS	197	32	24	10	11	4
UK	190	31	23	13	1	2
WK	123	60	170	51	233	2

In BBS, during the 121 surveys/patrols in 2006, 278 independent sign of rhino were encountered including four sightings.

In Way Kambas, during the 88 surveys/patrols in 2006, 700 independent sign of rhino were encountered including two sightings.

In Ujung Kulon, during the 44 surveys/patrols in 2006, 260 independent sign of rhino were encountered including two sightings.

The **RHINO DENSITY INDICATORS** table attempts to provide crude indicators of rhino density by relating the number of locations where some rhino signs were encountered with the surveying effort. This is based on the assumption that the number of some signs of rhino encountered will be proportional to the effort (field days, distance walked, etc.) of the RPUs in a certain area. The numbers in the column Density Indicator's - a rhino sign per unit of RPU activity - are therefore rough indicators of the relative densities of the rhino between the areas. See *Table 2. Rhino Density Indicator 2006.* 

The Density Indicators for the Sumatran rhino in WK and BBS do not very much between the areas, but those for Ujung Kulon are all much lower. This is most likely not an indication of a low Javan rhino density, but more likely caused by differences in the methods of calculation of field activities of the RMPUs.

Table 2. RHINO DENSITY INDICATORS 2006.

	Rhino			RPU Field Presence		Density Indicator			
Working	Α	B*	С	D	A/C	A/D	B/C	B/D	
Area	Number of Footprint	Number of Rhino signs*	Field Days**	Distance Walked	Rhinos/ 100 days	Rhinos/ 1000 km	Rhinos/ 100 days	Rhinos/ 1000 km	
TNBBS	197	81	688	2532	17,01	46,21	7,41	20,14

TNUK	190	70	435	1823	43,68	104,22	16,09	38,40

#### **Bukit Barisan Selatan National Park.**

BBS is one of the highest priority areas for Sumatran megafauna in particular for the Sumatran Rhino, the Sumatran Tiger, and the Sumatran Elephant. Approximately 60 - 85 Rhinos, 40 - 50 Tigers, and about 500 Elephants inhabit BBS.

Historically, in Bukit Barisan Selatan National Park the rhino was distributed throughout the park. Rhino signs were found not just deep in the forest but also in disturbed forest and on the edges of coffee plantations.

Population of Sumatran rhino in BBS is producing based on discovery of small footprints of Sumatran rhino (FF = 15 - 18 and AA = 13 - 18) and direct sighting the RPU team to calf and mother of Sumatran rhino.

Field observation during 2006 and based on field report 2006, the RPUs estimated number of rhino in Bukit Barisan Selatan is about 66 - 76 individuals based on the size of the area where rhinos are found and an estimate of average density that is close to the accepted 'normal' density of one rhino per 1000 ha. Moreover, the RPUs estimated number of rhinos in every plotting area. See the table 3 and figure 2 below.

Tabel 3. Estimation of number and distribution of rhinos in BBSNP in 2006

Plotting Area	Estimated number of
	rhinos
Bumbon, Kubu Perahu, Krui	12 – 14 individual
Biha, Pegunungan Pius, Marang	9 – 11 individual
Mendati, Krengseng, Way Rilau	10 – 12 individual
Pemerihan, Bamban, KM. 50, Sukaraja Atas	12 – 19 individual
Penengahan, Menanga Kanan, Way Haru	8 – 10 individual
Tampang, Tanjung Mas, Belambangan	7 – 10 individual
TOTAL	66 – 76 individual

Figure 2 Rhino distribution in BBS 2006.

Rhino, Tiger, Elephant and Tapir distribution in the Park have considerable overlap although there are significant differences in distribution and abundance throughout the Park.

During field surveys in 2006, RPUs encountered 61 locations of tiger's' footprints, 106 locations of Tapir's footprints, and 44 locations of Elephant's footprints in BBS National Park. See figure 3 below.

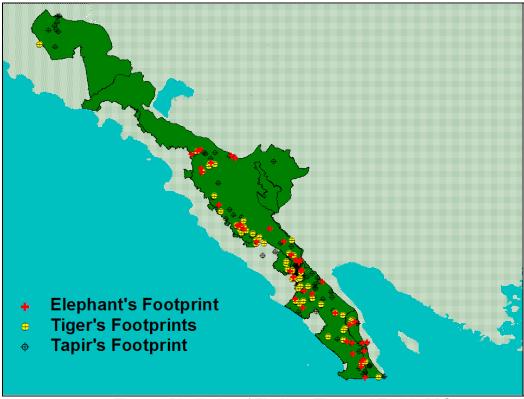

Figure 3. Distribution of Elephant, Tiger, and Tapir in BBS 2006.

# Way Kambas National Park.

In Way Kambas, during the 107 times of surveys/patrols in 2005, 160 locations of rhino's footprints, 68 wallows, 170 dungs, 43 foods, 276 other signs and one direct sighting, has been encountered.

Field observation during 1997 - 2004. The number of rhino in Way Kambas estimated 15 - 25. In 2005 and 2006, minimum 20 individuals were counted based on fact finding of rhino's signs.

Most of the footprints encountered within the Core Zone and a few in the Conservation Zone and Wilderness Zone of the Way Kambas National Park. See Figure 4 below.

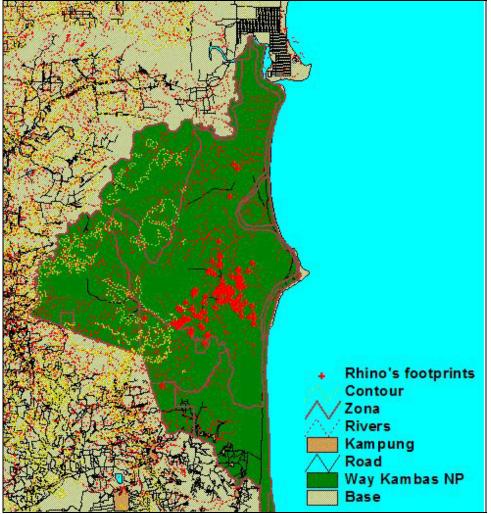

Figure 4. Rhino distribution in Way Kambas 2006.

#### Ujung Kulon National Park.

The National Park is famous for its population of Javan rhino, the only remaining population in Indonesia. During the patrols, a large number of rhino tracks, dung, food plants, and other sign were found in 2006.

Based on the data distribution in the rhino database the Javan rhino population is concentrated in three major areas; Cikeusik, Cibandawoh, and Cibunar. (Ci = river)

The population of Javan rhino in Ujung Kulon National Park is breeding. The WWF-Indonesia and Ujung Kulon NP staff provided evidence from the camera trap program of the birth of 4 calves in 2000 and 2001.

In September 2006, WWF Indonesia and Park staff claimed that they have found signs of four Javan rhino calves in Ujung Kulon. The first sign of calf was three days old of a small footprint (about 17 - 16 cm) along with a larger footprint presumably the mothers. The second sign was also another set of three days old mother and calf footprints, which was different in size to the first one and found in different area. The third sign was direct sighting of a female calf rhino and her mother by another team of survey but on the same day as the first and second signs was discovered. The fourth sign was found on the next day and in different area, in form of small footprint of Javan rhino.

In the same month, the RPU Ujung Kulon NP found five locations of footprints of javan rhino calf (size 18 - 17) and its mother. However, the distance of these locations were close to one another (not more than a half kilometer). A set of footprints found across the river Cigenter. Presumably, those signs came from the same individual.

In November 2006, the WWF-Indonesia's team and Ujung Kulon National Park authority got a camera trap picture of a baby Javan rhino. The picture shows a baby rhino standing just behind its mother.

Figure 5. A baby Javan rhino stands just behind its mother. Camera trap photograph. © Photo credit – WWF Indonesia/Ujung Kulon National Park Authority

Since there has been no rhino poaching for several years and there is no other outside interferences that potentially could have disturbed the rhino and its habitat, the population should slowly expand, and not be stable as is indicated in the series of population estimates carried out over the last 25 years. The results of the population census indicate that the rhino has reached carrying capacity, but at a much lower level than 30 years ago. This is reason for concern, since a population of only 40-50 animals is in serious danger of becoming extinct even if there is no poaching.

Possible causes for this lack of growth include reduction of feeding opportunities through the increase of closed canopy forest, the invasive spreading of unpalatable palm species in the under story, and food competition with Banteng.

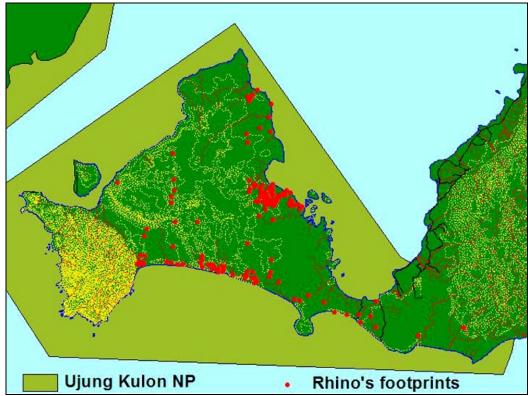

Figure 6. Javan rhino distribution in Ujung Kulon National Park 2006.

# **ILLEGAL ACTIVITIES ENCOUNTERED**

#### **Outputs:**

More accurate and reliable information on illegal activities encountered within the National Park such as illegal poaching, forest encroachment, field crops, illegal fishing, and others.

#### Progress:

During the surveys and patrols many offences detected and numbered of people or suspects interdicted. The Number of offence detected is tabulated below.

Tabel 3. Illegal activities encountered in the park during 2006.

Working Area	Encroachment	Timber Theft	Rhino/Trap	Non Rhino (Mammals)	Other
TNBBS	21	7	0	12	6
TNWK	14	21	1	12	28
TNUK	3	0	0	0	1
Total All Areas	38	28	1	24	35

#### **Bukit Barisan Selatan National Park.**

In BBS, during the surveys and patrols 46 offences detected. See the break down of cases above.

Most cases detected were forest encroachment or forest conversions into land for agriculture. The forest is also mainly converted into coffee plantation and rice field. Although poaching is the immediate threat to the rhino, encroachment remains the biggest long-term threat to the park as rhino habitat. The rhino become more endangered by fragmentation of its habitat through indiscriminate forest clearance and forest conversion into agricultural land.

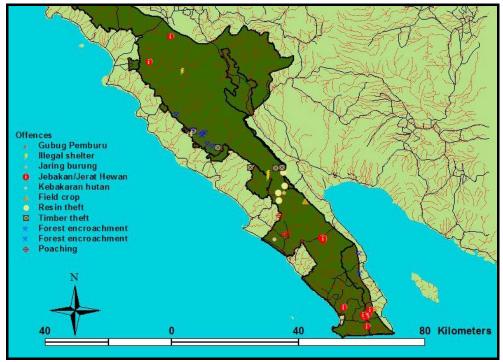

Figure 7. Offences detected in BBS NP 2006.

The number of cases detected decreased sharply than previous year. The RPUs in BBS have been very successful in preventing illegal logging in 2005. In May 2005, Forest Rangers of BBS and local police succeeded in arresting nine suspects of illegal logging along with the evidences, three trucks totally loaded with 472 pieces ( $\pm$  11,5 M³) of processed wood. The loggers manipulated the document. Two of them, HERMAN BIN HAMID and SUROTO BIN SUJANGI, were convicted to eight months imprisonment.

During the year, no case of rhino poaching encountered. However, in several locations pit-trap for a large mammal, fitted with sharp wood lances, were discovered. Even if the traps were set for other species, they could kill or wound a rhino accidentally. Fortunately, no evidence of killed or wounded rhinos found. The traps spread around Bukit Peranduan Lumut, upper Air Nasal, A. Pondok Barja, upper Way Tenumbang, and Pematang Melintang.

An Intelligence and law enforcement operation succeeded in uncovering three cases of wildlife poaching. See table 4 below.

Date	Case/Suspects	Evidences	Verdict
January 16, 2006	Illegal trade/ Rusdi bin Mansyur (42 years old)	A piece of tiger skin, length 89 cm.	10 months imprison and 500.000 rupiahs fine (date April 4, 2006).
March 18, 2006	Illegal trade/ Pahri Bin Zaiti (36 years old)	2 pieces of tiger skin 4 cm x 7 cm, 6 small pieces of deer skin, and 1 deer horn.	10 months imprison and 250.000 rupiahs fine (July 13, 2006).
March 19, 2006	Illegal poaching (and trade)/  - Subani Bin Jani (41 years old)	Binturong skin (1 pcs)	10 months imprison and 250.000 rupiahs fine (July 13, 2006).
	<ul> <li>Taslim Bin Murhis (45 years old)</li> </ul>	<ul> <li>Traditional gun/locok (1 pcs),</li> <li>Deer horn (1 pcs),</li> <li>Bear clawn (1 pcs),</li> <li>Projectile, ammunition (inside a bottle).</li> </ul>	18 months imprison and one million rupiahs fine (date July 13, 2006).

Tabel 4. Three cases of wildlife poaching or trading in BBS uncovered during 2006.

Figure 8. A Forest ranger of BBS National Park arrested Rusdi bin Masyur (42 years old), a wildlife trader along with tiger skin as evidence.

#### **Way Kambas National Park.**

In Way Kambas, during the surveys and patrols, the RPUs detected 76 offences, almost 28% of cases were timber theft and 16% of cases were illegal poaching targeted on a deer or wild pig. Sometimes the teams could arrest the poachers, but in most cases, the team only could collect the evidence. RPUs detected more than fifties traps targeting deer, wild pig, and only a few tigers. Identified areas where the RPUs encountered many traps than any other place, such as Way Tidung, Sartam, and Perambahan. However, most cases were found in Way Kambas was illegal fishing and bird theft.

For many years, the RPUs in Way Kambas have been very successful in preventing any poaching of rhinos, and so far, no poaching specifically targeting rhino has been recorded. However, In November 2006, the teams found a young rhino skeletons in a wallow. The rhino was killed by a single shot from above through the head while in a deep, trench like wallow. (See Figure 9 below).

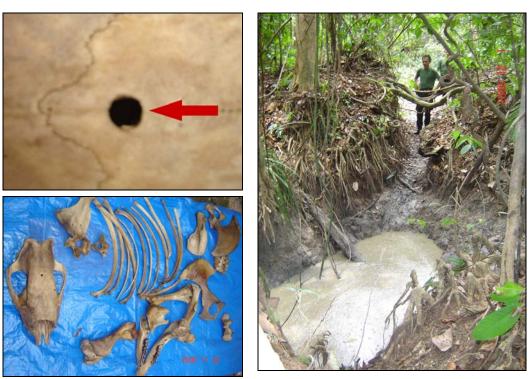

Figure 9. The poachers killed rhino by shot at the head (see the hole on rhino skull above). The rhino were wallowing while the poachers came then killed him (right).

The RPUs estimated that the killing of the rhino occurred about 3 weeks before the skeleton was found. This location was also visited by an RPU about two months before, and is one of the few places in Way Kambas where there is some fresh water in the dry season.

The killed rhino was still young (subadult) and the killers took the horn (must have been very small), the hooves, and probably also the skin. It appeared that other people took some of the bones before the RPU visited the location.

The Intelligence and Law Enforcement (ILEU) was dispatched from BBS to assist the RPUs and the National Park with this case. After they have investigated the crime scene, they concluded that the killers were a group of 4 – 8 people that entered Way Kambas from the north (Rasau or Camp 5000). The killers left few traces, but the team concluded that the hunters were not professional rhino hunters that were actively targeting rhino. It appeared that it was a chance encounter of a group of hunters with a rhino, that did not notice the hunters or

could not get away quick enough from the deep wallow. The gun used was a 7.62 mm army rifle, probably an M-16.

Although the RPUs have been very successful in preventing any poaching of rhinos, they could have not been able to stop encroachment to the Park. Over the last two years, massive encroachment has occurred along the southern boundary of the park, by villagers falsely claiming traditional land rights. So far, the authorities have not responded to this infringement and if unchallenged it's likely that people will settle across the park borders in other places as well. So far the areas encroached, about 10% of the Park area, are not suitable for rhino, but the infringements are moving closer and closer to the rhino habitat. Furthermore the new settlements are points of departure for poachers and loggers that penetrate now far into the interior of the Park.

As can be seen on the map most cases of timber theft found close to the park boundary. See figure 7 below. The RPUs also found many forest fire cases in every zone of Way Kambas that frequently occurred in dry season.

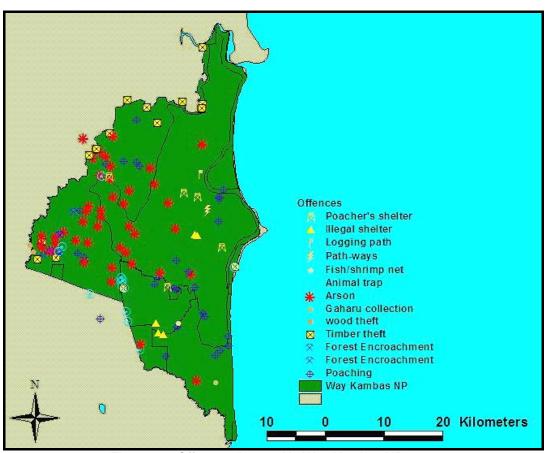

Figure 10. Offences detected in Way Kambas NP 2006.

# **Ujung Kulon National Park.**

Since 1998 anti-poaching patrols (RPUs) have been operating in Ujung KUlon under the Program Konservasi Badak Indonesia / Indonesian Rhino Conservation Program (PKBI / IRCP). Since the start of the RPU program no poaching has occurred, although the risk has steadily intensified. Even before the establishment of the RPUs, the detected cases of rhino poaching were rare.

#### **Conclusions**

Currently, there are six RPUs and two TPUs operating in Bukit Barisan Selatan, five RPUs in Way Kambas, and three RMPUs in Ujung Kulon National Park. These units play an important role in the monitoring of the populations of rhino, tiger, elephant, tapir and other endangered mammals in each park. The units also formed to counteract all forms of wildlife crime and habitat destruction, like illegal logging and encroachment.

The RPUs have been fully accepted as part of the Park management structure though administratively they are not under the direct supervision of the Park. Technically, they are responsible to the Head of the National Park through the Field Coordinator.

Cooperation with the National Parks and with the local authorities has been generally very good, and the RPU activities are accepted as a very valuable contribution toward the protection and management of the Parks. Joint operations with the Park Rangers have been conducted from time to time when the situation demands a larger number of people to participate in operations.

Bukit Barisan Selatan National Park in Sumatra, Indonesia, is one of the highest priority areas for the Sumatran Rhino, the Sumatran Tiger, the Sumatran Elephant and Tapir. These key wildlife populations are surviving in the wild as the RPUs has encountered their signs by patrol.

The Sumatran rhino population in BBS NP is viable at present but at risk of local extinction. Although poaching pressure on Sumatran rhino within the areas covered by the RPUs has reduced to the point of elimination since no trap or poacher detected by patrol, forest encroachment and timber theft, which was occupied 48% of all offences encountered, remains the biggest threat to the Park as rhino habitat. The rhino become more endangered by its habitat loss through indiscriminate forest clearance and forest conversion into agricultural land. Moreover, the park is not more than a few kilometers wide in most places hence, mainly in southern half of BBS, a few rhinos found in local villages or in the edge of locals' plantations that is too risky for rhino's life. Therefore, the southern half of BBS is most intensively patrolled by the RPU.

Way Kambas supports one of the larger populations of the Sumatran Rhino, with probably 15-25 individuals living mainly in the forested eastern side of the National Park as many of their signs encountered by patrol. The RPUs in Way Kambas have been very successful in preventing any poaching of rhinos, and so far, no poaching specifically targeting rhino has been recorded, though poaching for meat and sport is still occur in Way Kambas.

Access to large areas of the Park is comparatively easy, because of the open nature of large parts of the forest and because the existence of old logging roads, built in 60s. Therefore, over the last two years massive encroachment has occurred along the Southern boundary of the park, by villagers falsely claiming traditional land rights. So far the authorities have not responded to this infringement and if unchallenged it's likely that people will settle across the park borders in other places as well. To date, the areas encroached, about 10-15 % of the Park area, are not suitable for rhino, but the infringements are moving closer and closer to the rhino habitat. Furthermore the new settlements are points of departure for poachers and loggers that penetrate now far into the interior of the Park.

Intelligence and Law Enforcement that implemented since 2002 in Bukit Barisan Selatan and Way Kambas National Parks be appreciated successfully hence many illegal poachers, traders and people involved, taken to court to get the justice. RPUs also unable to identified the network and "modus operandi" of illegal poaching. Since then, illegal poaching case

decreased sharply, in fact no rhino poaching detected in this year, but still need to monitor and protect rhinos in Bukit Barisan Selatan and Way Kambas National Park.

#### Recommendations

The Sumatran rhinoceros remains a highly endangered species and will remain so in the immediate future. For an anti-poaching program to be effective, it must be ongoing. Any pause and relaxation in the program would lead to an undoing of the progress achieved as the poachers would follow the situation closely and move back to the areas currently protected. In a few months, the progress made in many years of work could be undone as it only taken a few groups of skilled poachers to exterminate most rhinos in an area.

Although poaching is the immediate threat to the rhino, encroachment remains the biggest long-term threat to the park as rhino habitat. Therefore, there must be stop or halt area encroachment so that area is secure for use by rhinos again. Stop new roads, mining activities, over exploitation of the forest, etc. in the National park. In BBS, the encroachment inside the Park that occupied 30,000 families should be reversion.

The Activities of the RPUs have a significant impact on the conservation of natural landscape, because the RPUs not only prevent rhino poaching, but are also active in arresting and preventing habitat degradation though illegal logging, theft of forest products including wildlife, and illegal settlements. Therefore, RPUs should remain in place in Bukit Barisan Selatan and Way Kambas National Park on Sumatra and in Ujung Kulon national Park on Java.

The number of units should be gradually increased and deployed in an expanding area in order to enlarge secure habitats in the Parks, and allow rhinos and other wildlife to return to areas where they were exterminated in the past. The IRCP RPU program will remain critical for the continued survival of the Javan and Sumatran rhino throughout the implementation period of the Indonesian Rhino Conservation Startegy and Action Plan.

The Sumatran Rhino in Way Kambas are most vulnerable situation and continued presence of anti-poaching units is vital to discourage rhino poachers from near Kerinci or Barisan Selatan to try their luck in Way Kambas. The existing massive encroachment should be removed, and then the areas need to be reforested and turned into secure rhino habitat.

Establishment secondary habitat for javan rhino after immediately identifying and securing habitat and future translocations. Additional habitat is not available locally and that Ujung Kulon NP will never have a population large enough to secure the long-term survival of the species. Gunung Halimun NP as a potential site for a second Javan rhino population.
