RHINOCEROS SKULL FOR MUSEUM.

RECENT ACQUISITIONS AT KENSINGTON.

Recent acquisitions at the Natural History Museum include a bequest by the late Mr. Philip Roscoe of over 5,000 specimens of lower carboniferous fossils collected by Mr. Roscoe in Derbyshire, Staffordshire, and Yorkshire. These form a valuable addition to the Museum collection and are contained in five large and well-made cases which in themselves would be of great service to the Museum.

Lord Leverhulme has presented a complete skull, lower jaw, and baleen of both sides of a female fin whale. This specimen, which weighs between five and six tons, was received at the Museum in one large case.

A number of purchases have been made, including a skull of the prehistoric rhinoceros *Elasmotherium sibiricum* from Siberia. Skulls of this rhinoceros are exceedingly rare, and the only specimen comparable with this one is in Leningrad. Another important purchase is that of a magnificent crystal of Olivine (Peridot) of gem quality from the island of St. John, in the Red Sea. The crystal weighs 137 grams, or 685 carats, and is the largest ever found.

The other purchases include a large and valuable selection of minerals, comprising 195 specimens, from the United States of America; nearly 3,000 specimens of flowering plants and cryptogams from the Philippine Islands; 202 bird skins from Cameroon; two casts of South African bushmen, a male and a female; and 210 fossil sponges from Southern Germany.

Casts have been received by exchange from the American Museum of Natural History, New York, of the fossilized Dinosaur eggs discovered by the expedition sent by that Museum to Mongolia.
